Professional Skill

- UI/UX Design ●●●●○
- Graphic Design ●●●●○
- Web Design ●●●●○

Personal Skill

- Creative ●●●●○
- Leading ●●●●○
- TeamWork ●●●●○

Passion & Hobbies

- Watching
- Tea
- Reading
- Habitat
- Traveling
- ListenMusic
- Designing

to be the most important. It is also important to note that the effects of the different variables are not necessarily additive, and that the effect of one variable may be dependent on the level of another variable. For example, the effect of the number of employees may be different depending on the size of the company. The following table shows the results of the regression analysis. The dependent variable is the number of employees, and the independent variables are the size of the company, the number of employees, and the number of employees squared. The results show that the number of employees is a significant predictor of the number of employees, and that the effect of the number of employees is positive. The results also show that the effect of the number of employees squared is negative, which suggests that the effect of the number of employees is decreasing as the number of employees increases.

The following table shows the results of the regression analysis. The dependent variable is the number of employees, and the independent variables are the size of the company, the number of employees, and the number of employees squared. The results show that the number of employees is a significant predictor of the number of employees, and that the effect of the number of employees is positive. The results also show that the effect of the number of employees squared is negative, which suggests that the effect of the number of employees is decreasing as the number of employees increases.
